DETAILED ACTION

Response to Arguments

1. Applicant's arguments with respect to claim 15, 18, 19 have been considered but are moot in view of the new ground(s) of rejection.

Claim Rejections - 35 USC § 103

2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

3. Claims 15, 18, 19 are rejected under 35 U.S.C. 103(a) as being unpatentable over Hedlund (US 5,136,584) in view of Yang et al. (US 5,856,977).

Hedlund discloses a communication system comprising the following features: as depicted in Figs. 1, 3, 5, regarding claim 15, an adapter in a network equipment comprising: input ports (SEND DMA CTRLR. 206) receiving network variable length data packets (column 5, lines 32-34); a frame process component storing as words said data packets in a storage unit (SEND BUFFER 260), creating control blocks with packet information (column 9, lines 19-26), and a packet segmenting process component (DATA SEGMENTER 205) preparing the segmenting information for assembling each fixed length cell from packets in packet queues; regarding claim 18, wherein each fixed length cell includes 64 units (column 6, line 15); regarding claim 19, including cell assembler component using the segmenting information

Art Unit: 2667

(column 9, lines 27-51) to segment the packet in the queue selected by the scheduler (CONTROL SEQUENCER 416). See column 4-25.

Hedlund does not disclose the following features: regarding claim 15, creating queues of packet going to the same destination address and creating control blocks with packet information; a scheduler designating a packet queue to be served at a given time.

Yang et al. discloses a communication system comprising the following features: regarding claim 15, creating queues (Fig. 10, SHARED BUFFERS 102) of packet going to the same destination address; a scheduler designating a packet queue to be served at a given time (column 7, lines 20-24; column 8, lines 47-53). It would have been obvious to one of the ordinary skill in the art at the time of the invention to modify the system of Hedlund, by using the features, as taught by Yang et al., in order to provide an efficient data communication system by preventing cell contention and cell loss. See Yang et al., Abstract, lines 13-16.

Allowable Subject Matter

4. Claims 1-14, 16, 17 are allowed.
